Supplementary Figure 1. Endoscopic features of 4 representative gastric pure (de novo) DLBCLs responsive to \textit{H. pylori} eradication therapy.  (A) Before \textit{H. pylori} eradication therapy treatment (HPE), circumferential ulcerative mass at upper to middle body in endoscopic examination.  (B) which showed significant regression with gastric erosion and ulcer scar in gross after 6 months of HPE.  (C) Before HPE, an irregular-shaped ulcer with marked surrounding erythema and fold convergence at the antrum.  (D) Five months after HPE, complete regression of ulceration with hyperemic and atrophic mucosa at the antrum.  (E) An ulcer with nodular margin at the anterior wall of the antrum.  (F) One month after HPE, complete regression of ulceration with hyperemic mucosa.  (G) Before HPE, endoscopic examination revealed an irregular ulceration with elevated, nodular margin at the antrum. (H) Three months after HPE, a wide-based whitish scar was seen at the antrum.
