Figure S1. Subsequent malignancies in Hodgkin lymphoma survivors (continued). Second and third malignancies occurring either as ipsilateral malignancies (with different histology) or as contralateral cancers (in paired organs) were included. “Female breast cancer” includes DCIS tumors. Twenty-four patients had a synchronous second and third malignancy (breast n=10, urogenital tract n=3, GI tract n=2, different sites/organ systems n=9). Interval in years. HL=Hodgkin lymphoma; 2nd=second malignancy; 3rd=third malignancy; GI=gastrointestinal (esophagus excluded); NHL=non-Hodgkin lymphoma.
