# Table 2: List of studies excluded at full text screening stage with brief reasons

Title	Journal	First Author, Published	Exclusion Reason
Tackling early morbidity and mortality in myeloma: Assessing the benefit of antibiotic prophylaxis and its effect on healthcare associated infections	Haematologica	Year Drayson 2011	Duplicate
Immunogenicity and safety of an adjuvanted herpes zoster subunit vaccine in adult autologous hematopoietic stem cell transplant recipients: phase 3, randomized, placebo-controlled, ZOEHSCT clinical trial	Bone marrow transplantation	Sullivan 2019	Duplicate
Effect of various doses of intravenous polyclonal IgG on in vivo levels of 12 pneumococcal antibodies in patients with chronic lymphocytic leukaemia and multiple myeloma.	Oncology	Sklenar 1993	Wrong outcomes
Role of gamma globulin for immunoprophylaxis in multiple myeloma.	The New England journal of medicine	Salmon 1967	Wrong route of administration
Levofloxacin prophylaxis in patients with newly diagnosed myeloma (TEAMM): a multicentre, double-blind, placebo-controlled, randomised, phase 3 trial	The Lancet	Drayson 2019	Duplicate
Randomized Trial of Lenalidomide and Dexamethasone Versus Clarythromycin, Lenalidomide and Dexamethasone As First Line Treatment in Patients with Multiple Myeloma Not Candidates for Autologous Stem Cell Transplantation: Results of the GEM-Claridex Clinical Trial	Blood	Puig 2019	Duplicate
Randomized trial of lenalidomide and dexamethasone versus crythromycin, lenalidomide and dexamethasone as first line treatment in patients with multiple myeloma not candidates for autologous stem cell transplantation: results of the GEM-claridex clinical trial	Blood	Puig 2019	Duplicate
Immunogenicity and safety of the adjuvanted recombinant zoster vaccine in adults with haematological malignancies: a phase 3, randomised, clinical trial and post-hoc efficacy analysis	The Lancet	Dagnew 2019	Duplicate
Doses of 13-valent conjugated pneumococcal vaccine (PCV13) for patients with multiple myeloma (MM)	Open Forum Infectious Diseases	Sun 2018	Duplicate
Conjugated pneumococcal vaccine triggers a better immune response than polysaccharide pneumococcal vaccine in patients with chronic lymphocytic leukemia a randomized study by the Swedish CLL group	Haematologica	Svensson 2017	Duplicate
Tandem high-dose influenza vaccination is associated with more durable serologic immunity in patients with plasma cell dyscrasias	Blood Advances	Branagan 2021	Duplicate
Does curative intravenous immunoglobulin therapy improve outcome in the treatment of infections in chronic lymphoid leukemia?	Critical care	Benlabed 2020	Wrong study design
The prosid study: evaluating eicacy and safety of intravenousimmunoglobulin (IVIG) 10% in primary infection prophylaxis inpatients with chronic lymphocytic leukemia-study design	Blood	Cornely 2020	Duplicate
Immunogenicity, safety, and post-hoc efficacy assessment of the adjuvanted recombinant zoster vaccine in adults with hematologic malignancies: a phase 3, randomized clinical trial	Open forum infectious diseases	Dagnew 2018	Duplicate

Oral third-generation cephalosporins vs. levofloxacin for antibacterial prophylaxis in neutropenic patients with hematologic malignancies	Open forum infectious diseases	DeVoe 2019	Wrong patient population
Tackling early morbidity and mortality in myeloma (TEAMM): assessing the benefit of antibiotic prophylaxis and its effect on healthcare associated infections in 977 patients	British journal of cancer	Drayson 2018	Duplicate
Immunoglobulin prophylaxis against cytomegalovirus infection in patients at high risk of infection following allogeneic hematopoietic cell transplantation	Transplantation proceedings	Ichihara 2011	Wrong patient population
The importance of continued follow-up in cancer trials: results from the TEAMM myeloma trial assessing the benefit of 12 weeks levofloxacin prophylaxis on febrile episodes or deaths	Trials	Iqbal 2019	Duplicate
Pneumococcal vaccine responses in B cell malignancies and dysfunctions	Haematologica	Karlsson 2013	Wrong study design
Immunogenicity and safety of an adjuvanted herpes zoster subunit candidate vaccine in adults with hematologic malignancies: a phase III, randomized clinical trial	Open forum infectious diseases	Oostvogels 2017	Wrong outcomes
A randomized prospective study of ceftazidime and ciprofloxacin with or without teicoplanin as an empiric antibiotic regimen for febrile neutropenic patients	British journal of haematology	Lim 1990	Wrong patient population
Lenalidomide and dexamethasone plus or minus clarythromycin in newly diagnosed multiple myeloma patients ineligible for autologous stem cell transplantation: updated results of the gemclaridex trial	Hemasphere	Puig 2020	Duplicate
Doses of 13-valent conjugated pneumococcal vaccine (PCV13) for patients with multiple myeloma (MM)	Open forum infectious diseases	Sun 2018	Wrong outcomes
Conjugated pneumococcal vaccine triggers a better immune response than polysaccharide pneumococcal vaccine in patients with chronic lymphocytic leukemia a randomized study by the Swedish CLL group	Haematologica	Svensson 2017	Wrong outcomes
A randomised trial of two 2-dose influenza vaccination strategies for patients following autologous haematopoietic stem cell transplantation	Hemasphere	Teh 2020	Duplicate
Two dose series of high-dose influenza vaccine is associated with longer duration of serologic immunity in patients with plasma cell disorders	Blood. Conference: 59th Annual Meeting of the American Society of Hematology, ASH	Branagan 2017	Duplicate
Two dose series of high-dose influenza vaccine is associated with longer duration of serologic immunity in patients with plasma cell disorders	Haematologica	Branagan 2018	Wrong outcomes
The prosid study: Evaluating efficacy and safety of intravenous immunoglobulin (IVIG) 10% in primary infection prophylaxis in patients with chronic lymphocytic leukemia-study design	Blood	Cornely 2020	Duplicate
Oral antibiotic prophylaxis of early infection in multiple myeloma: A URCC/ECOG phase III study	Blood Annual Meeting of the American Society of Hematology, ASH	Vesole 2010	Duplicate
Poxvirus vectored cytomegalovirus vaccine to prevent cytomegalovirus viremia in transplant recipients: A phase 2, randomized clinical trial	Annals of Internal Medicine	Aldoss 2020	Wrong patient population
Levofloxacin prophylaxis in newly diagnosed myeloma reduces febrile episodes and death without increasing healthcare associated infections: Results from the teamm trial	HemaSphere	Bowcock 2018	Duplicate

x 71 · 1 · · · 1 · · · 1			<b>D</b>
Levofloxacin prophylaxis in newly diagnosed myeloma reduces febrile episodes and death without increasing healthcare associated infections: Results from the teamm trial (tackling early	British Journal of Haematology	Bowcock 2018	Duplicate
morbidity and mortality in myeloma)			
Immunogenicity, safety, and post-hoc efficacy assessment of the adjuvanted recombinant zoster vaccine in adults with hematologic malignancies: A phase 3, randomized clinical trial	Open Forum Infectious Diseases	Dagnew 2018	Wrong outcomes
Tackling early morbidity and mortality in myeloma (TEAMM): Assessing the benefit of antibiotic prophylaxis and its effect on healthcare associated infections in 977 patients	British Journal of Cancer	Drayson 2018	Duplicate
Clarithromycin and lenalidomide combination: A full oral regimen for relapsed/ refractory malt lymphoma patients. results of the international extranodal lymphoma study group IELSG40/CLEO trial	HemaSphere	Ferreri 2020	Wrong study design
TEAMM Work Saves Lives in Myeloma	HemaSphere	Hallam 2018	Duplicate
Immunogenicity and safety of an adjuvanted herpes zoster subunit candidate vaccine in adults with hematologic malignancies: A phase III, randomized clinical trial	Open Forum Infectious Diseases	Oostvogels 2017	Wrong outcomes;
Lenalidomide and dexamethasone plus or minus clarythromycin in newly diagnosed multiple myeloma patients ineligible for autologous stem cell transplantation: Updated results of the gemclaridex trial	HemaSphere	Puig 2020	Duplicate
A randomised trial of two 2-dose influenza vaccination strategies for patients following autologous haematopoietic stem cell transplantation	HemaSphere	Teh 2020	Duplicate
Low neutralizing antibody responses against SARS-CoV-2 in older patients with myeloma after the first BNT162b2 vaccine dose	Blood	Terpos 2021	Wrong study design
	NIHR Journals Library. Efficacy and Mechanism Evaluation	Chicca 2020	Duplicate
Clinical efficacy of pneumococcal vaccination in multiple myeloma patients on novel agents: Results of a prospective clinical study.	Vaccine	Stoma 2020	Wrong study design
Levofloxacin prophylaxis in patients with myeloma.	The Lancet. Oncology	Albrich 2020	Wrong study design
Levofloxacin prophylaxis in patients with myeloma.	The Lancet. Oncology	Teh 2020	Wrong study design
Levofloxacin prophylaxis in patients with myeloma - Authors' reply.	The Lancet. Oncology	Drayson 2020	Wrong study design
Antibiotic prophylaxis for patients with newly diagnosed multiple myeloma: Systematic review and meta-analysis.	European journal of haematology	Mohyuddin 2020	Wrong study design
Pneumococcal conjugate vaccine triggers a better immune response than pneumococcal polysaccharide vaccine in patients with chronic lymphocytic leukemia A randomized study by the Swedish CLL group.	Vaccine	Svensson 2018	Wrong outcomes
Immunoglobulin replacement in chronic lymphocytic leukaemia.	Nouvelle revue francaise d'hematologie	Bunch 1988	Duplicate
A randomized placebo-controlled phase II study of clarithromycin or placebo combined with VCD induction therapy prior to high-dose melphalan with stem cell support in patients with newly diagnosed multiple myeloma	Blood	Gregersen 2017	Duplicate

Clarithromycin added to the VCD regimen causes reduced health-related quality of life in multiple	HemaSphere	Nielsen 2018	Duplicate
myeloma patients Recent advances in the treatment of chronic	C	D 1002	XX/mana at 1

multiple myeloma Hypogammaglobulinaemia in low grade B cell	Immunology,	Chapel 1991	Wrong study

Protected environment-prophylactic antibiotic program for malignant lymphoma. Randomized trial during chemotherapy to induce remission.	The American journal of medicine	Bodey 1979	Wrong patient population
Human immunoglobulin	Prescrire International	Anonymous 1996	Wrong study design
Phase III randomized, double-blind, placebo controlled trial of North American (NA) ginseng (Panax quinquefolium) extract (CVT-E002) in patients with chronic lymphocytic leukemia: Effect on respiratory infection and antibiotic use	Journal of Clinical Oncology	High 2010	Wrong intervention
Better response with conjugate vaccine than with polysaccaride vaccine 12 months after rituximab treatment in lymphoma patients.	British journal of haematology	Svensson 2012	Wrong outcomes
One-year safety and immunogenicity of two formulations of an adjuvanted varicella-zoster virus (VZV) subunit candidate vaccine in adult autologous hematopoietic cell transplant (HCT) recipients	Biology of Blood and Marrow Transplantation	Stadtmauer 2013	Duplicate
Prophylaxis against infections with intravenous immunoglobulins in multiple myeloma.	British journal of haematology	Musto 1995	Duplicate
Vaccination of patients with haematological malignancies with one or two doses of influenza vaccine: a randomised study.	British journal of haematology	Ljungman 2005	Wrong outcomes
Intravenous immune globulin in chronic lymphocytic leukaemia.	Clinical and experimental immunology	Gamm 1994	Wrong study design
Correlation between immunoglobulin dose and incidence of severe and serious infections in secondary immunodefficiencies	Journal of Clinical Oncology	Ehlers 2017	Wrong study design
Efficacy of different immunoglobulin doses in the prevention of severe and serious infections in patients with secondary immunodeficiencies- results from a multicenter observational study with Privigen	Oncology Research and Treatment	Ehlers 2017	Wrong study design
Rational selection of patients for antibacterial prophylaxis after chemotherapy.	Journal of clinical oncology : official journal of the American Society of Clinical Oncology	Cullen 2007	Wrong study design
Lower rates of influenza infection following two dose series of high dose vaccination in plasma cell disorders: Results of a randomized, double-blind, place bo-assisted clinical trial	Blood	Branagan 2016	Wrong comparator
Use of patient diaries in conjunction with standard reporting methods: Duplication of data or a valuable resource?	Trials	Dunn 2015	Wrong study design
Clinical trials of dendritic cell-based cancer vaccines in hematologic malignancies.	Human vaccines & immunotherapeutics	Pyzer 2014	Wrong intervention
Treatment of high-risk aggressive B-cell non- Hodgkin lymphomas with rituximab, intensive induction and high-dose consolidation: long-term analysis of the R-MegaCHOP-ESHAP-BEAM Trial.	Leukemia & lymphoma	Pytlik 2015	Wrong intervention
Lack of response to vaccination in MGUS and stable myeloma	Blood	Prabhala 2009	Wrong outcomes
Lenalidomide-induced immunomodulation in multiple myeloma: impact on vaccines and antitumor responses.	Clinical cancer research : an official journal of the American Association for Cancer Research	Noonan 2012	Wrong outcomes
Effect of meropenem with or without immunoglobulin as second-line therapy for pediatric febrile neutropenia	Pediatrics International	Kobayashi 2014	Wrong patient population
A phase 2 study of lenalidomide to repair immune synapse response and humoral immunity in early-	Blood	Jones 2016	Wrong comparator

### **Supplementary Information**

#### Clinically documented infections

From the trials evaluating Ig, three trials (Boughton 1995, Chapel 1994, Cooperative CLL 1988) evaluating IVIg and one trial (Vacca 2018) evaluating SCIg reported the number of episodes of CDIs.(9, 12, 30) In one study (Boughton 1995), the overall number of CDIs were reported but not by treatment arm.(9) We were unable to pool these outcomes in a meta-analysis as no standard deviation were provided for the RCTs evaluating IVIg; and in the RCT evaluating SCIg, the outcomes were reported per person-time but time was not provided in the denominator and there were varying follow-up times. Results are reported narratively. In Boughton 1995, 122 infections occurred in 18 of the 42 study patients.(9) In Chapel 1994, 19 serious infections occurred in 449 patient-months in the Ig arm, compared to 38 in 470 patient-months in the placebo arm.(30) In Cooperative CLL 1988, 66 infections occurred in 41 patients receiving Ig compared to 81 infections in 42 patients on placebo.(12) In Vacca, 85 infections (16 major, 69 minor) occurred in 24 patients receiving Ig vs. 333 infections (190 major, 143 minor) in 22 patients in the control arm.(16)

From the trials evaluating antibiotics, two trials reported the number of CDIs. However, as no standard deviation was provided, we were unable to pool these outcomes in a meta-analysis. Results are reported narratively. In Drayson 2019, the number of CDIs was 257 in antibiotic arm vs. 329 in control arm. In Oken, the number of CDIs were 5 in antibiotic arm vs. 16 in control arm.

#### Microbiologically documented infections

From the trials evaluating Ig, the proportion of patients with one or more bacterial infections was used in the meta-analysis from one of these trials (Cooperative CLL 1988). Two trials (Boughton 1995, Chapel 1994) reported the number of MDIs in each arm.(9, 30) However, as no standard deviation was provided, we were unable to pool these outcomes in a meta-analysis. Results are reported narratively. In Boughton 1995, 19 (from a total of 122) infections had bacterial pathogens isolated.(9) In Chapel 1994, infections in patients on Ig arm were classified into 23 bacterial, 40 viral and 3 fungal vs 42 bacterial, 37 viral and 2 fungal infections in patients on the control arm.(30)

From the trials evaluating antibiotics, one trial reported on the numbers of MDIs. From 977 patients, the number of MDIs was 44 in the antibiotic arm vs. 68 in the control arm (Drayson 2019).(17)

From the trials evaluating VZV vaccinations, four studies were not included in the meta-analysis – one study used clinical criteria for diagnosis of herpes zoster infection,(23) three studies (Winston 2018, Stadtmauer 2014, Stadtmauer 2021) confirmed CDIs by a combination of PCR testing or on the basis of blinded adjudication and we were unable to ascertain from these numbers, the proportion of patients with VZV confirmation by PCR testing alone.(25, 26, 28) Microbiological testing was not specified in the trial evaluating influenza vaccination.(24)

## Hospitalisations due to infection

One study (Vacca 2018) evaluating SCIg reported on the duration of hospitalisation due to severe infections. (16) Mean days/year of hospitalisation due to severe infections were 8 in the SCIg arm vs. 121 in the control arm (p<0.001). One study (Drayson 2019) evaluating prophylactic oral antibiotics reported on the number of hospitalisations and intensive care admissions. (17) The number of hospitalisations for infection was 88 (from 489 patients) in the antibiotic arm vs 114 (from 488 patients) in control arm, and the number of intensive care admissions was 3 (from 489 patients) in the antibiotic arm vs. 5 (from 488 patients) in the control arm. None of the other studies reported on hospitalisations or intensive care admissions due to infection.

## Adverse events

From the trials evaluating Ig, Ig prophylaxis significantly increased the risk of adverse events, RR 2.23 (95% CI 1.67 to 2.99). From the Chapel 1994 study, we included the proportion of patients with adverse events of at least moderate severity in this meta-analysis

as the number of all-grade adverse events was reported by total events, rather than by proportion of patients. In the study evaluating SCIg, adverse events were reported in the treatment arm only, which were predominantly mild and comprised of local injection site reactions.(16)

From the trials evaluating antibiotics, we did not include the Drayson study in our meta-analysis as the authors reported the number of adverse events as event outcomes (instead of proportion of patients).(17) They reported a total of 308 serious adverse events from 489 patients in the intervention arm vs. 289 serious adverse events from 488 patients in the control group. The majority of serious adverse events were reported as unlikely or unrelated to study drug. From 308 serious adverse events in the intervention group, events thought related to study drug included tendonitis (in five patients), confusion (one patient). Other mild adverse events included nausea, diarrhoea, chills/fever, rash and musculoskeletal pains.

From the trials evaluating VZV vaccinations, one study reported adverse events leading to treatment discontinuation, which were similar between arms.(28) From the trials evaluating influenza vaccination, there were no reported adverse events leading to treatment discontinuation.

#### Crossover studies evaluating prophylactic immunoglobulin

Three studies had a crossover study design and were not included in the meta-analysis as data for first randomisation was not available. Importantly, no washout period was reported in these trials so carry-over effect is not excluded. More details are provided in the appendix (Supplementary information).

The first trial (Griffiths 1989) reported on 12 patients (8 with CLL and 4 with low-grade NHL) with hypogammaglobulinaemia or a recent history of recurrent infections.(13) Patients were randomised to receive either IVIg 0.4g/kg or saline infusion every 3 weeks for 12 months, and were then switched to the alternative preparation for another 12 months. A total of 41 CDIs occurred in 143 patient-months during the IVIg period compared with 68 CDIs in 121 patient-months during the standard care (saline infusion) period. Serious infections, defined as life-threatening infections requiring hospitalisation and intravenous therapy (major infections) or anti-bacterial therapy (moderate infections), were also reported, and 18 serious infections occurred in 143 patient-months during the IVIg period compared with 46 CDIs in 121 patient-months during the standard care (saline infusion) period.

The second trial (Musto 1995) reported on 25 patients with multiple myeloma with hypogammaglobulinaemia or a recent history of recurrent infections.(15) These patients were randomised to receive either IVIg 0.3g/kg every 4 weeks or no therapy (observation) for 6 months, switched to the alternative arm for 12 months, then switched again to the original arm for another 6 months. A total of 33 CDIs (of which 10 were serious infections) occurred in 261 patient-months during the IVIg period compared with 57 CDIs (of which 30 were serious infections) in 250 patient-months during the standard care (observation) period. Serious infections were not specifically defined in this study.

The third trial (Molica 1996) reported on 42 patients with CLL with hypogammaglobulinaemia or a history of at least one infection during the previous six months.(14) Patients were randomised to receive either IVIg 0.3g/kg every 4 weeks or no therapy for 6 months, switched to the alternative arm for 12 months, then switched again to the original arm for another 6 months. A total of 41 CDIs (of which 5 were serious infections) occurred in 376 patient-months during the IVIg period compared with 62 CDIs (of which 8 were serious infections) in 368 patient-months during the standard care (observation) period.

## Prophylactic immunoglobulin comparing different doses

One study compared different doses of prophylactic Ig with results reported in two publications.(12, 31) The authors (Chapel 1994 and Gamm 1994) reported on reported on 36 patients with haematological malignancies (34 patients with CLL and 2 with NHL)

and hypogammaglobulinaemia or a recent history of one or more serious infections. Patients were randomised to receive either IVIg 0.5g/kg or 0.25g/kg every 4 weeks for 12 months.

Four CLL patients died, two patients in each treatment group; one death in the low-dose treatment group was due to infection. A total of 23 CDIs (of which 6 were serious infections) occurred in 180 patient-months in the high-dose IVIg group compared with 22 (of which 11 were serious infections) CDIs in 223 patient-months in the low-dose IVIg group. Thirteen MDIs occurred in 180 patient-months in the high-dose IVIg group compared with 19 in 223 patient-months in the low-dose IVIg group. Treatment-related adverse events were reported in two of 16 CLL patients in the high-dose IVIg group compared to eight of 18 CLL patients in the low-dose IVIg group.(31)

## Prophylactic vaccinations comparing differing doses of vaccinations

Two trials compared differing doses of VZV(25) and influenza vaccination.(27) One study compared three doses of VZV glycoprotein E (gE) vaccine adjuvanted with AS01B vs. three doses of gE adjuvanted with AS01E vs. two doses of gE/AS01B vs. placebo.(25) In this comparison, we evaluated outcomes in patients receiving three vs. two doses of gE/AS01B vaccine. One study compared high-dose (HD) inactivated influenza vaccine followed by standard dose (SD) vaccine (HD-SD arm) or 2 SD vaccines (SD-SD arm) in patients with myeloma or lymphoma post autologous stem cell transplant.(27) There was no difference in CDIs or adverse events in both studies (Appendix 17, 18, 19).
